Symptoms related to the physical, chemical and toxicological characteristics

- In the preregistration trials of belzutifan, serum aminotransferase elevations occurred in up to 20% of patients, but were invariably transient and mild (less than 3 times ULN) and were not accompanied by symptoms or jaundice. No patient required dose modification or discontinuation because of liver test abnormalities. Furthermore, since its more widespread use after its approval, there have been no published reports of clinically apparent liver injury attributed to belzutifan. Likelihood score: E (unlikely cause of clinically apparent liver injury).
